Linear Regression with Gradient Descent

Outline

Introduction

Linear Regression

Introduction

What is Machine Learning

"Field of study that gives computers the ability to learn without being explicitly programmed." – Arthur Samuel, IBM, Stanford University, 1959

"A computer program is said to learn from experience E with respect to some task T and some performance measure P, if its performance on T, as measured by P, improves with experience E." – Tom Mitchell [Mit97]

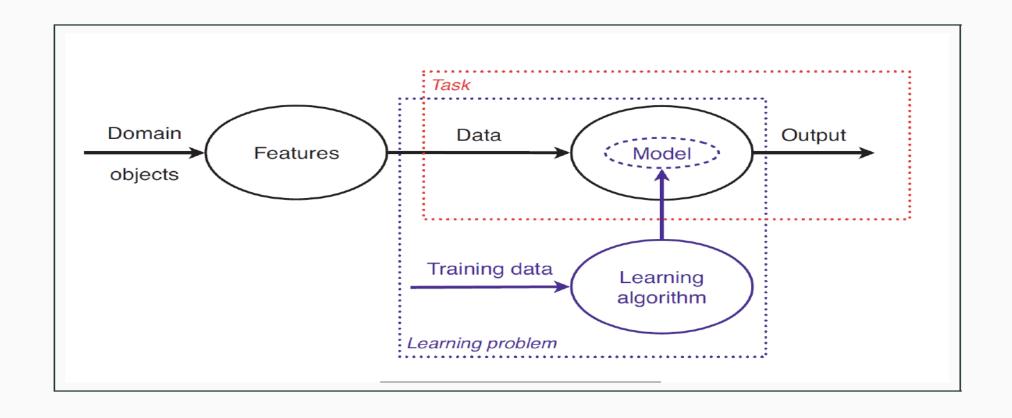

"Instead of writing a program by hand, we collect lots of examples that specify the correct output for a given input. A machine learning algorithm then takes these examples and produces a program that does the job." — Geoffrey Hinton [Hin14]

Applications

- Pattern recognition
 - Facial identities, medical images
 - Handwritten text
- Prediction
 - Stock prices
 - Marketing campaign outcomes
- Classification
 - Spam detection
 - Find similar content

Addressing a Task

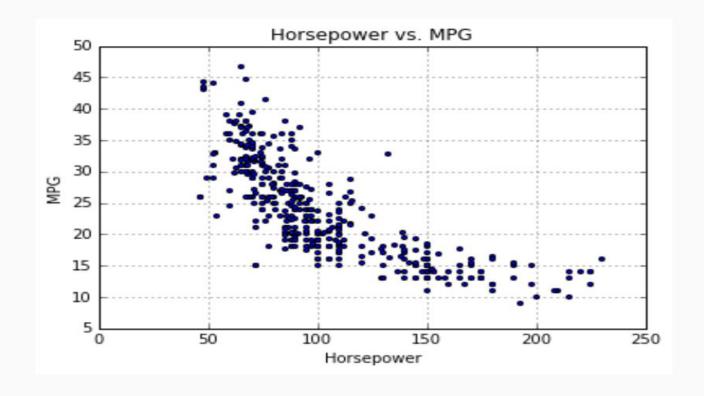

"...tasks are addressed by models, whereas learning problems are solved by learning algorithms that produce models." [Fla12]

MPG vs Horsepower

Simple use-case

- Auto MPG Data Set
- Predicting MPG
 based on Horsepower

Linear Regression

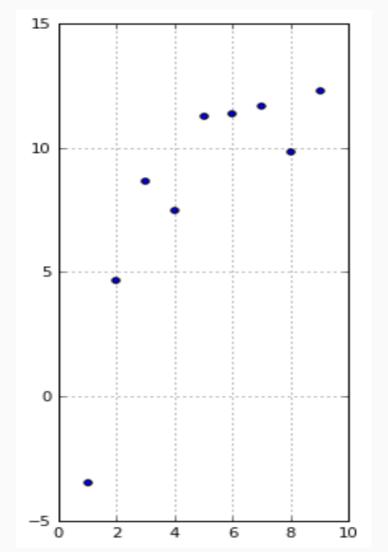

Univariate Linear Regression

- Model a single response (dependent, outcome) variable based on one or more input (independent, predictor) variables
- Assume linear relationship between input and response variables

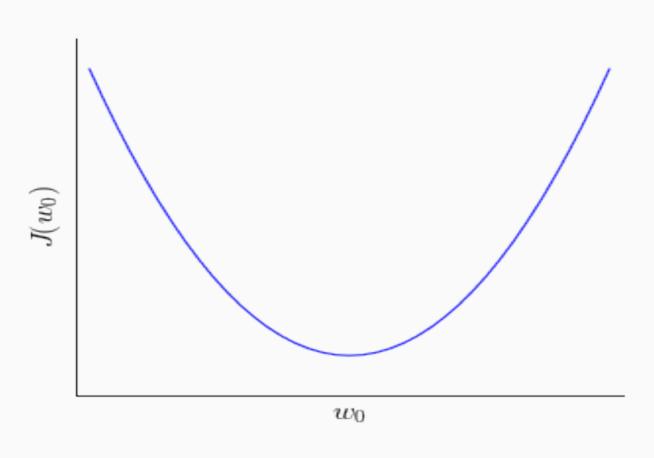

Univariate Linear Regression

Fitting a linear regression model

$$m{X} = \{ m{x}_1, m{x}_2, \dots, m{x}_N \}^T$$
 $m{y} = \{ y_1, y_2, \dots, y_N \}^T$
 $J(m{w}) = \sum_{i=1}^{N} (\hat{y}_i - y_i)^2$
 $J(m{w}) = \frac{1}{2N} \sum_{i=1}^{N} (\hat{y}_i - y_i)^2$

Gradient Descent

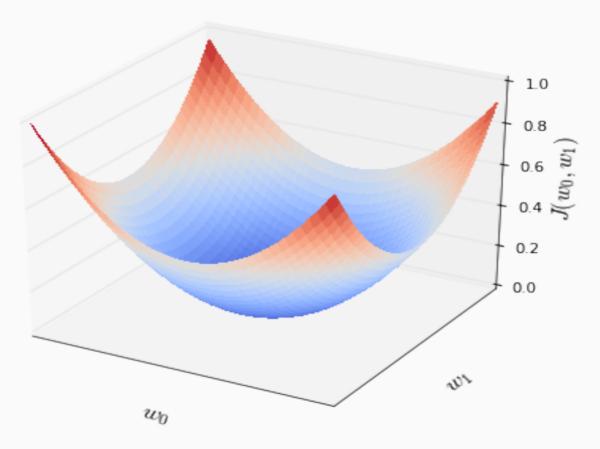

Update rule

$$\frac{d}{dw_0}J(w_0)$$

$$w_0 := w_0 - \alpha \frac{d}{dw_0}J(w_0)$$

- A positive $\alpha \frac{d}{dw_0} J(w_0)$ moves w_0 to the left
- A negative $\alpha \frac{d}{dw_0} J(w_0)$ moves w_0 to the right

Two parameters cost function

Solution

$$\frac{\partial}{\partial w_j} J(w_0, w_1)$$

repeat until convergence {

Simultaneously update for every j:

$$w_j := w_j - \alpha \frac{\partial}{\partial w_j} J(\boldsymbol{w})$$

}

Gradient Descent – Multiple Regression

$$X = \{x_1, x_2, \dots, x_N\}^T$$

$$y = \{y_1, y_2, \dots, y_N\}^T$$

$$w = \{w_0, w_1, \dots, w_D\}^T$$

$$w_j := w_j - \alpha \frac{\partial}{\partial w_j} J(w)$$

$$\frac{\partial}{\partial w_j} J(w) = \frac{\partial}{\partial w_j} \frac{1}{2N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 = \frac{1}{2N} \sum_{i=1}^N \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{2N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 = \frac{1}{N} \sum_{i=1}^N (\hat{y}_i - y_i)^2 \frac{\partial}{\partial w_j} (\hat{y}_i - y_i)^2 \frac$$

Matrix Notation

$$\begin{bmatrix} \hat{y}_1 \\ \hat{y}_2 \\ \vdots \\ \hat{y}_N \end{bmatrix} = \begin{bmatrix} 1 & x_{11} & x_{12} & \dots & x_{1D} \\ 1 & x_{21} & x_{22} & \dots & x_{2D} \\ \vdots & \vdots & \ddots & \vdots \\ 1 & x_{N1} & x_{N2} & \dots & x_{ND} \end{bmatrix} \begin{bmatrix} w_0 \\ w_1 \\ \vdots \\ w_D \end{bmatrix}$$

Hypothesis: $\hat{m{y}} = m{X}m{w}$

Cost function:
$$J({m w}) = \frac{1}{2N} \sum_{i=1}^N ({m X}{m w} - {m y})^T ({m X}{m w} - {m y})$$

Update rule:

repeat until convergence {

$$\boldsymbol{w} := \boldsymbol{w} - \alpha \frac{\boldsymbol{X}^T (\boldsymbol{X} \boldsymbol{w} - \boldsymbol{y})}{N}$$

_

$J(\theta)$ Solution by Differentiation

As given in Note 1, CS229 Lecture notes [Ng12]

$$\nabla_{\theta} J(\theta) = \nabla_{\theta} \frac{1}{2} (X\theta - y)^T (X\theta - y)$$

$$= \frac{1}{2} \nabla_{\theta} (\theta^T X^T X \theta - \theta^T X^T y - y^T X \theta + y^T y)$$

$$= \frac{1}{2} \nabla_{\theta} \text{tr}(\theta^T X^T X \theta - \theta^T X^T y - y^T X \theta + y^T y)$$

$$= \frac{1}{2} \nabla_{\theta} (\text{tr}\theta^T X^T X \theta - 2\text{tr}y^T X \theta)$$

$$= \frac{1}{2} (X^T X \theta + X^T X \theta - 2X^T y)$$

$$= X^T X \theta - X^T y$$
